

Depending on your application we can customise our inductive probes to meet your desired requirements, ranging from vacuum compatibility and mechanical probe changes to unique driver electronics and unusual calibrations. Do you have physical requirements, where probes need to have a specific shape to fit in a tight enclosure or need a special shielding around the probes to limit their sensitivity to environmental influences? Or do you need performance requirements, like working at certain temperatures or specific dynamic needs? Contact us and let us help you to achieve the best measuring solution for your application.
